

ABSTRACT OF THE DISCLOSURE

Device for preventing, restoring and healing treatment of muscles, tendons, joints, joint capsules, etc. of animals and particularly of large animals, includes a plate adapted to temporarily or permanently be arranged on a base where the animal is kept, the plate arranged to be set in vibration by means of at least one drive source. The plate is a functional single layer plate provided with a number of flexible spacers on its lower side to hold the plate a predetermined distance above an even base. The plate may be formed of at least two separate plate elements arranged adjacent to each other along an axis so that each plate element has an inner edge along the axis and an outer edge parallel to and at a distance from the axis.
